Explanation of ranking

This method of ranking is simply used for assessing environmental schemes and primarily assesses the benefits to the number of properties along a given road.

General data colated which will be used for the assessment includes: Length of road, width of road, number of properties, accidents and amenities in the area.

Scheme cost is based on the average number of traffic caiming features that would be necessary for the given length of road and includes the width of the carriageway, Property per cost factor is used to provide a multiplier in determining a number of properties which would equate to the benefit to them.

The score then adds the property per cost, accidents and other scores, and this value is used for ranking.
